Polynesia

Subregional overview

Malnutrition burden

In the Polynesia subregion, there has been some progress towards achieving global nutrition targets. The global target for infant exclusive breastfeeding has one country on course to meet it. However, not a single country in the subregion is on course to meet the targets for under-five overweight, under-five stunting, under-five wasting, anaemia in women of reproductive age, low birth weight, male diabetes, female diabetes, male obesity, and female obesity. Three countries in the subregion have insufficient data to comprehensively assess their progress towards these global targets.

Although it performs well against other subregions, Polynesia still experiences a malnutrition burden among its under-five population. The average prevalence of overweight in under-fives is 5.3% - the highest compared to other subregions in Oceania. The prevalence of stunting in under-fives is 4.9%, this is significantly less than the global average of 21.9%. The Polynesia subregion's prevalence of wasting in under-fives of 3.9% is also less than the global average of 7.3%.

Some 70.3% of infants under 23 months in the Polynesia subregion are exclusively breastfed, while there is insufficient data on low birth weight.

The Polynesia subregion's adult population also face a malnutrition burden. An average of 27.9% of women of reproductive age have anaemia, and 26.4% of adult women have diabetes, compared to 22.4% of men. Meanwhile, 54.9% of women and 40.7% of men have obesity.
