

Subregional overview

Malnutrition burden

In the Central Asia subregion, there has been some progress towards achieving global nutrition targets. The global targets for under-five stunting and under-five wasting each have three countries on course to meet them, under-five overweight has two countries on course, while low birth weight has one country on course. However, not a single country in the subregion is on course to meet the targets for infant exclusive breastfeeding, anaemia in women of reproductive age, male diabetes, female diabetes, male obesity, and female obesity. Two countries in the subregion have insufficient data to comprehensively assess their progress towards these global targets.

Although it performs relatively well against other subregions, Central Asia still experiences a malnutrition burden among its under-five population. The average prevalence of overweight in under-fives is 9.4% - the highest compared to other subregions in Asia. The prevalence of stunting in under-fives is 10.9%, this is significantly less than the global average of 21.9%. The Central Asia subregion's prevalence of wasting in under-fives of 3.6% is also less than the global average of 7.3%.

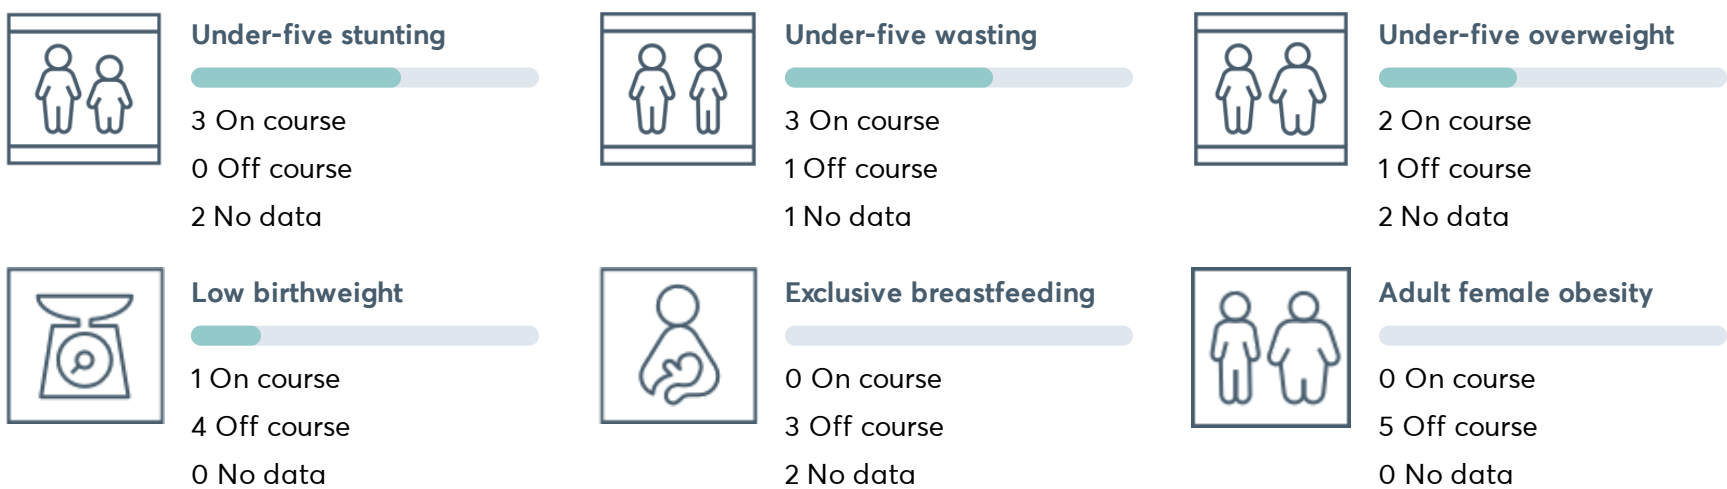

Some 40.9% of infants under 23 months in the Central Asia subregion are exclusively breastfed, while the subregion's average low birth weight prevalence of 5.4% is less than the global average of 14.6%.

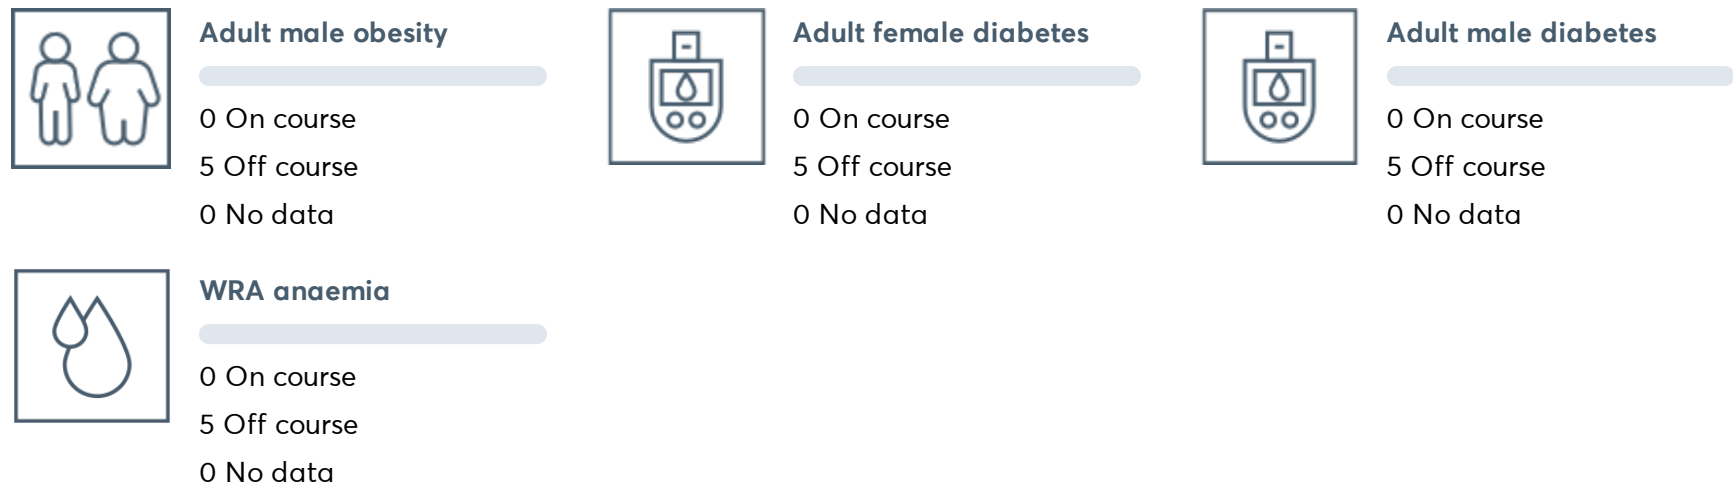

The Central Asia subregion's adult population also face a malnutrition burden. An average of 33.8% of women of reproductive age have anaemia, and 11% of adult men have diabetes, compared to 10.9% of women. Meanwhile, 19.8% of women and 15% of men have obesity.
