

Subregional overview

Malnutrition burden

In the Eastern Africa subregion, there has been some progress towards achieving global nutrition targets. The global targets for under-five overweight and under-five wasting each have six countries on course to meet them, infant exclusive breastfeeding has five countries on course, while under-five stunting has one country on course. However, not a single country in the subregion is on course to meet the targets for anaemia in women of reproductive age, low birth weight, male diabetes, female diabetes, male obesity, and female obesity. 14 countries in the subregion have insufficient data to comprehensively assess their progress towards these global targets.

Although it performs relatively well against other subregions, Eastern Africa still experiences a malnutrition burden among its under-five population. The average prevalence of overweight in under-fives is 4.3% - the second lowest compared to other subregions in Africa. The prevalence of stunting in under-fives is 35.2%, this is significantly greater than the global average of 21.9%. Conversely, The Eastern Africa subregion's prevalence of wasting in under-fives of 6% is less than the global average of 7.3%.

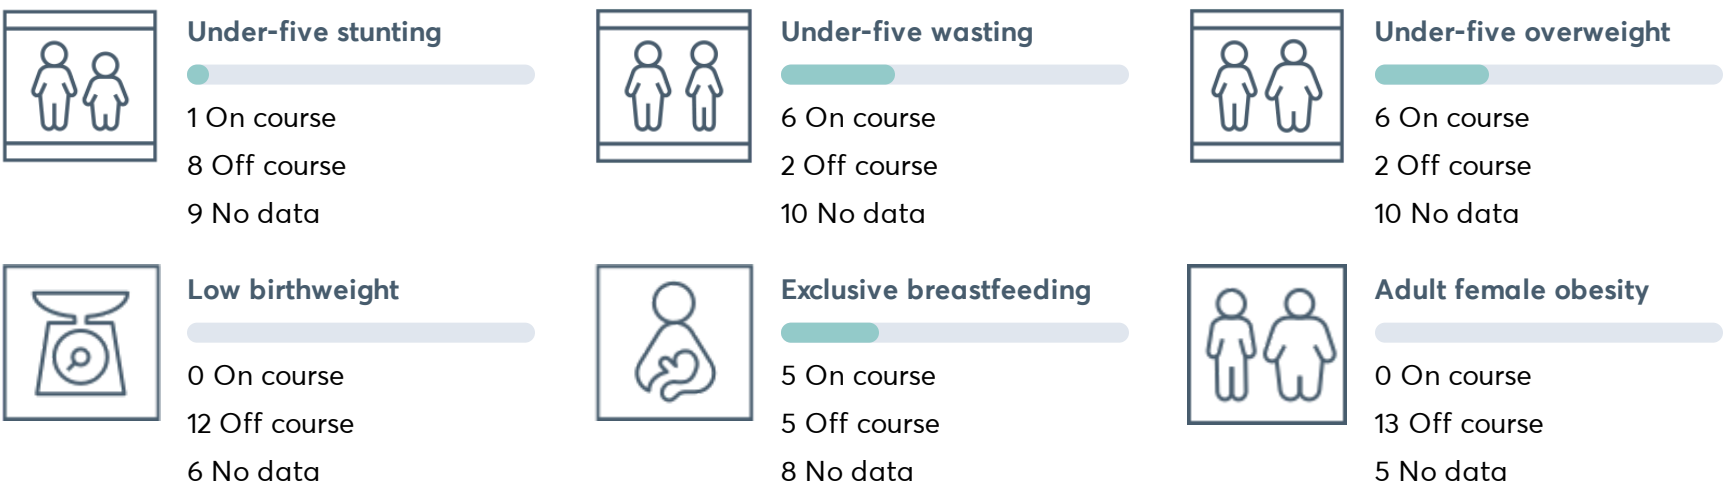

Some 59.7% of infants under 6 months in the Eastern Africa subregion are exclusively breastfed, while the subregion's average low birth weight prevalence of 13.4% is less than the global average of 14.6%.

The Eastern Africa subregion's adult population also face a malnutrition burden. An average of 31.3% of women of reproductive age have anaemia, and 5.9% of adult men have diabetes, compared to 5.6% of women. Meanwhile, 10.1% of women and 2.8% of men have obesity.
