

Overview

Malnutrition status

The West Bank and Gaza Strip is on course to meet the global targets for under-five stunting, under-five wasting, and infant exclusive breastfeeding, but is off course to meet the targets for all other indicators analysed with adequate data.

Although it performs relatively well against other developing countries, the West Bank and Gaza Strip still experiences a malnutrition burden among its under-five population. As of 2014, the national prevalence of under-five overweight is 8.2%, which has increased slightly from 5.3% in 2010. The national prevalence of under-five stunting is 7.4%, which is significantly less than the developing country average of 25%. the West Bank and Gaza Strip’s under-five wasting prevalence of 1.2% is also less than the developing country average of 8.9%.

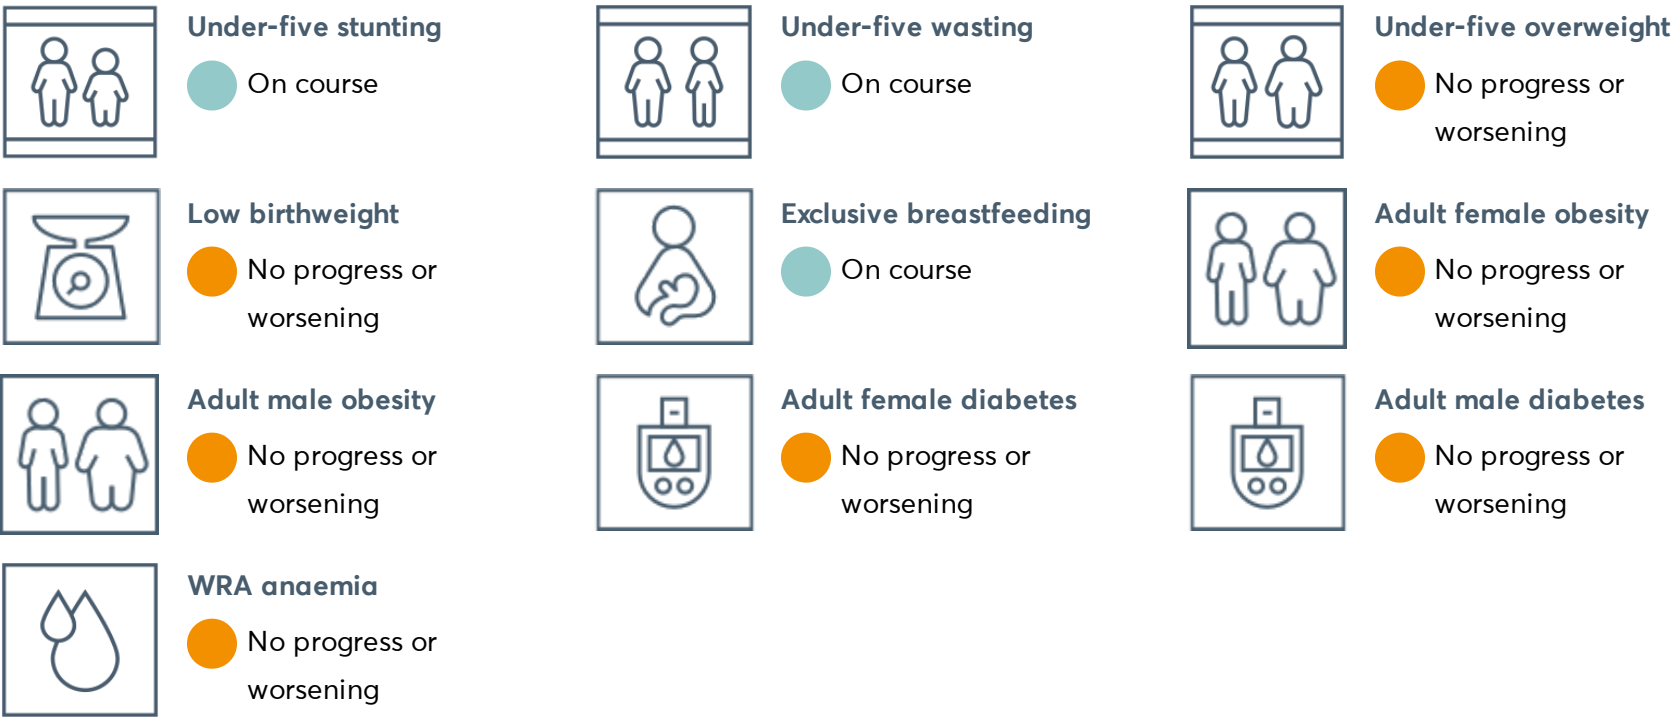

In the West Bank and Gaza Strip, 38.1% of infants under 23 months are exclusively breastfed, this is well above the Western Asia average of 24%. The West Bank and Gaza Strip’s 2015 low birth weight prevalence of 8.4% has remained constant since 2014.

The West Bank and Gaza Strip’s adult population also face a malnutrition burden. While there is no prevalence data available for anaemia among women of reproductive age, 17.5% of adult women suffer from diabetes, compared to 16.5% of men. Meanwhile, 38.8% of women and 26.2% of men suffer from obesity.
