

Overview

Malnutrition status

The Czech Republic is off course to meet the global targets for anaemia in women of reproductive age, low birth weight, male diabetes, female diabetes, male obesity, and female obesity. There is insufficient target data to assess the Czech Republic's progress for under-five overweight, under-five stunting, under-five wasting, and infant exclusive breastfeeding.

Although it performs relatively well against other countries, the Czech Republic still experiences a malnutrition burden among its under-five population. As of 2001, the national prevalence of under-five overweight is 4.4%. The national prevalence of under-five stunting is 2.6%, which is significantly less than the global average of 21.9%. the Czech Republic's under-five wasting prevalence of 4.6% is also less than the global average of 7.3%.

There is insufficient data on exclusive breastfeeding among infants. The Czech Republic's 2015 low birth weight prevalence of 7.8% has decreased slightly from 7.9% in 2000.

The Czech Republic's adult population also face a malnutrition burden. While there is no prevalence data available for anaemia among women of reproductive age, 8.4% of adult men suffer from diabetes, compared to 6.6% of women. Meanwhile, 26.4% of men and 25.4% of women suffer from obesity.
