

Overview

Nutritional information

In Micronesia, there has been some progress towards achieving global nutrition targets. 1 country is on course to meet the global targets for each of male diabetes and female diabetes. However, no countries in Micronesia are on course for each of under-five overweight, under-five stunting, under-five wasting, infant exclusive breastfeeding, anaemia in women of reproductive age, low birth weight, male obesity, and female obesity. 5 countries in Micronesia have insufficient data to comprehensively assess their progress towards these global targets.

Micronesia has no prevalence data available for under-five overweight, stunting, or wasting.

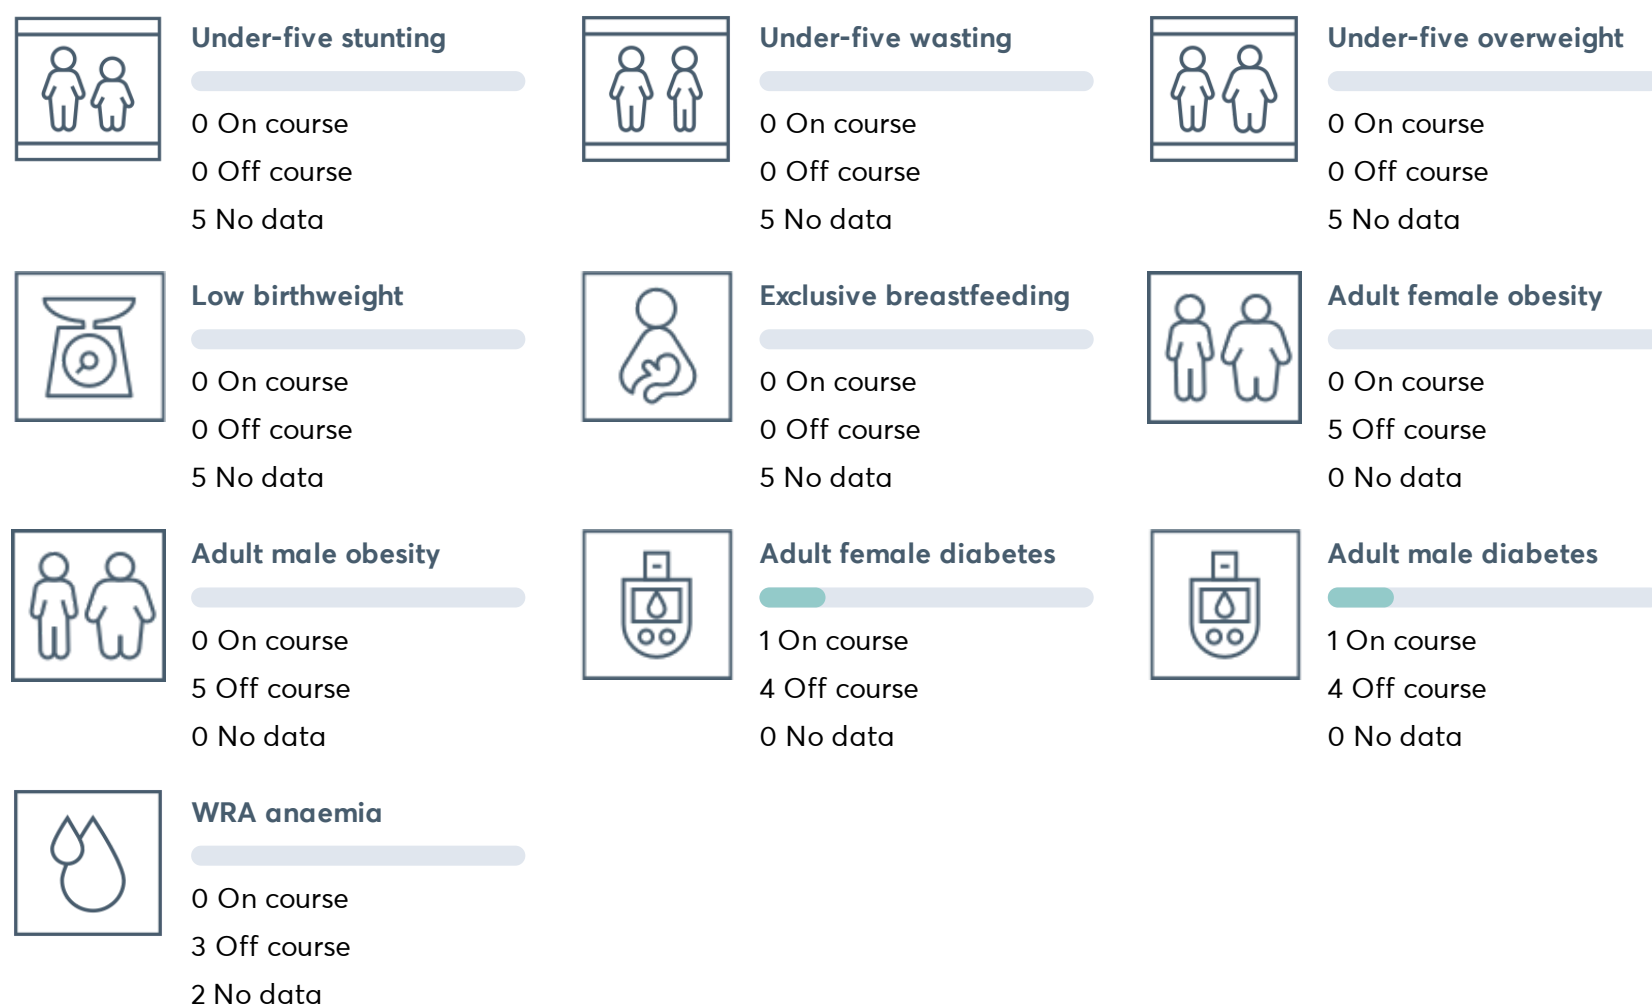

Some 42.3% of infants under 23 months in Micronesia are exclusively breastfed, while there is insufficient data on low birth weight.

Micronesia's adult population face a malnutrition burden. An average of 25.1% of women of reproductive age have anaemia, and 22.8% of adult women suffer from diabetes, compared to 21.7% of men. Meanwhile, 53.1% of women and 43.6% of men suffer from obesity.

Sources: UNICEF/WHO/World Bank Group: Joint child malnutrition estimates, NCD Risk Factor Collaboration, WHO Global Health Observatory.

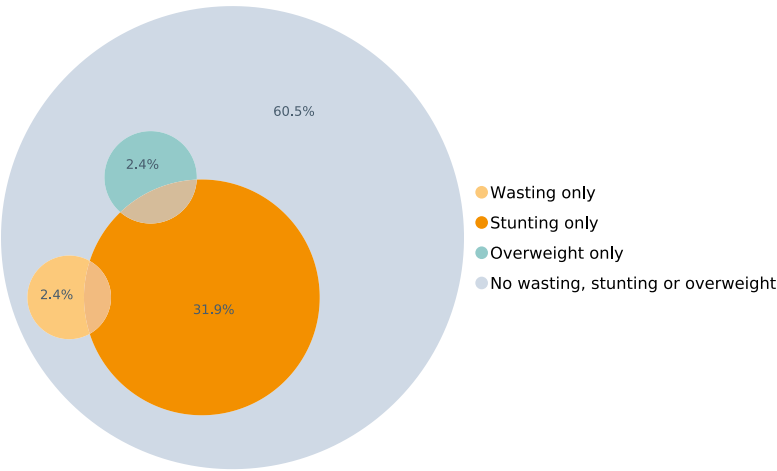

Notes: Thresholds for a country having the form or not: stunting in children aged under-five years >20%; anaemia in women of reproductive age >20%; overweight (body mass index >25) in adult women aged >18 years >35%.
