

## Country overview

### Malnutrition burden

**Libya is off course to meet the global targets for anaemia in women of reproductive age, male diabetes, female diabetes, male obesity, and female obesity. There is insufficient target data to assess Libya’s progress for under-five overweight, under-five stunting, under-five wasting, infant exclusive breastfeeding, and low birth weight.**

Although it performs relatively well against other developing countries, Libya still experiences a malnutrition burden among its under-five population. As of 2007, the national prevalence of under-five overweight is 22.4%. The national prevalence of under-five stunting is 21%, which is less than the developing country average of 25%. Libya’s under-five wasting prevalence of 6.5% is also less than the developing country average of 8.9%.

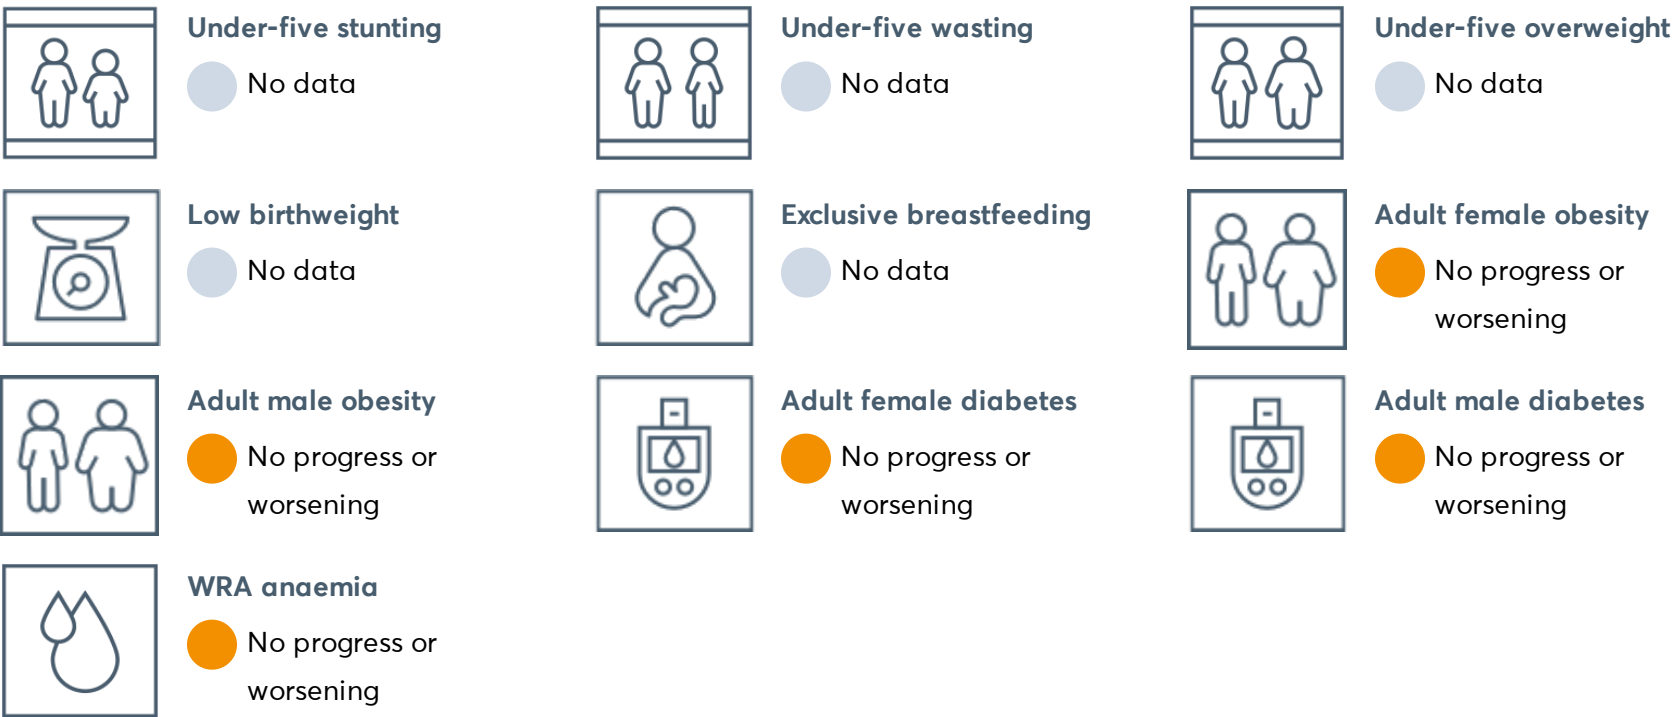

There is insufficient data on exclusive breastfeeding among infants, and on low birth weight.

Libya’s adult population also face a malnutrition burden. 32.5% of women of reproductive age have anaemia, and 16.6% of adult women have diabetes, compared to 15.2% of men. Meanwhile, 39.6% of women and 25% of men have obesity.
