

Southern Asia

Overview

Malnutrition status

In Southern Asia, there has been some progress towards achieving global nutrition targets. 3 countries are on course to meet the global target for under-five overweight. 2 countries are on course for infant exclusive breastfeeding. 1 country is on course for under-five stunting. However, no countries in Southern Asia are on course for each of under-five wasting, anaemia in women of reproductive age, low birth weight, male diabetes, female diabetes, male obesity, and female obesity. 8 countries in Southern Asia have insufficient data to comprehensively assess their progress towards these global targets.

Southern Asia experiences a malnutrition burden among its under-five population. The average prevalence of overweight in under-fives is 3.1% - the lowest compared to other subregions in Asia. The prevalence of stunting in under-fives is 32.7%, this is significantly greater than the global average of 21.9%. Southern Asia's prevalence of wasting in under-fives of 14.6% is also greater than the global average of 7.3%.

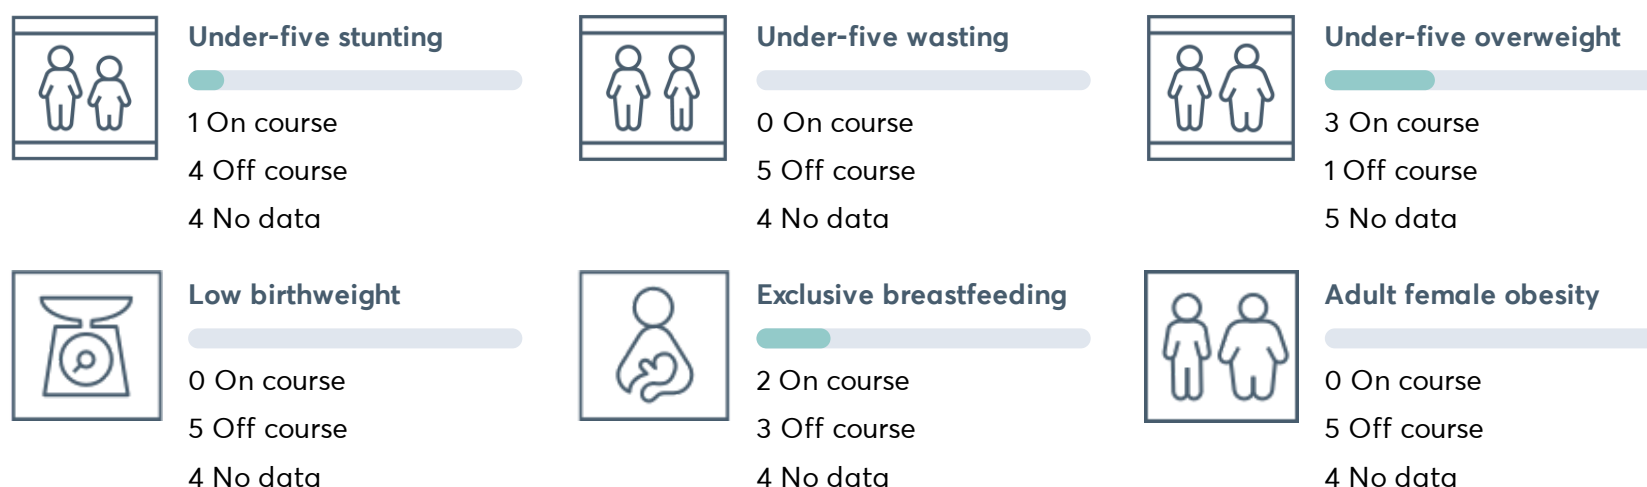

Some 53.9% of infants under 23 months in Southern Asia are exclusively breastfed, while the subregion's average low birth weight prevalence of 26.4% is significantly greater than the global average of 14.6%.

Southern Asia's adult population also face a malnutrition burden. An average of 49% of women of reproductive age have anaemia, and 9.7% of adult men suffer from diabetes, compared to 9.1% of women. Meanwhile, 7% of women and 3.8% of men suffer from obesity.
