

## Subregional overview

### Malnutrition burden

In the Micronesia subregion, there has been some progress towards achieving global nutrition targets. The global targets for male diabetes and female diabetes each have one country on course to meet them. However, not a single country in the subregion is on course to meet the targets for under-five overweight, under-five stunting, under-five wasting, infant exclusive breastfeeding, anaemia in women of reproductive age, low birth weight, male obesity, and female obesity. Five countries in the subregion have insufficient data to comprehensively assess their progress towards these global targets.

Although it performs relatively well against other subregions, Micronesia still experiences a malnutrition burden among its under-five population. The average prevalence of overweight in under-fives is 4.1% - the lowest compared to other subregions in Oceania. The prevalence of stunting in under-fives is 34.8%, this is significantly greater than the global average of 21.9%. Conversely, The Micronesia subregion's prevalence of wasting in under-fives of 3.5% is less than the global average of 7.3%.

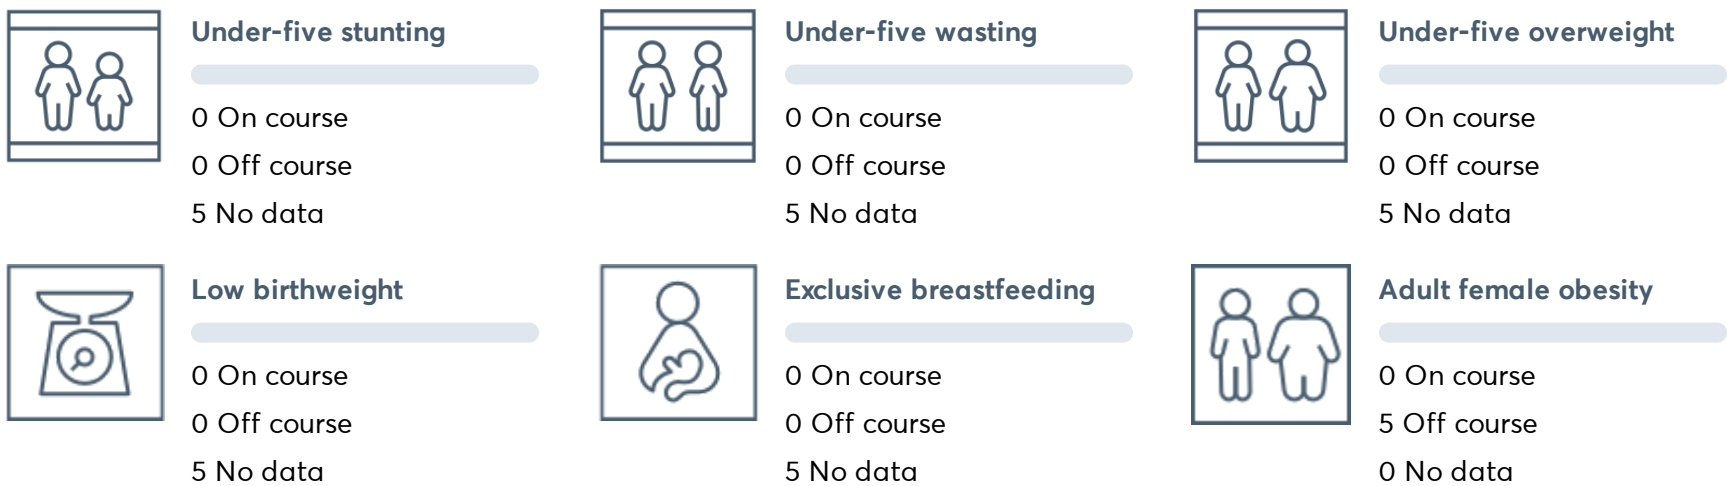

Some 42.3% of infants under 6 months in the Micronesia subregion are exclusively breastfed, while there is insufficient data on low birth weight.

The Micronesia subregion's adult population also face a malnutrition burden. An average of 25.1% of women of reproductive age have anaemia, and 22.8% of adult women have diabetes, compared to 21.7% of men. Meanwhile, 53.1% of women and 43.6% of men have obesity.
