# Saint Vincent and the Grenadines

### Overview

### Malnutrition status

Saint Vincent and Grenadines is off course to meet the global targets for anaemia in women of reproductive age, male diabetes, female diabetes, male obesity, and female obesity. There is insufficient target data to assess Saint Vincent and Grenadines' progress for under-five overweight, under-five stunting, under-five wasting, infant exclusive breastfeeding, and low birth weight.

Saint Vincent and Grenadines has no prevalence data available for under-five overweight, stunting, or wasting.

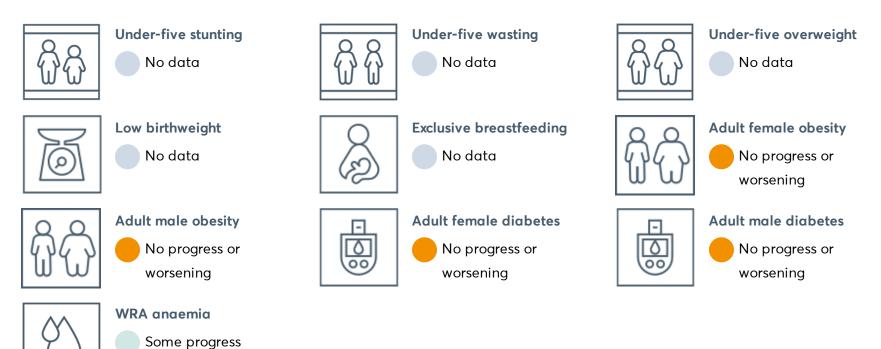

There is also insufficient data on exclusive breastfeeding among infants, and on low birth weight.

Saint Vincent and Grenadines' adult population face a malnutrition burden. While there is no prevalence data available for anaemia among women of reproductive age, 11.8% of adult women suffer from diabetes, compared to 9.3% of men. Meanwhile, 31% of women and 16.6% of men suffer from obesity.

Sources: UNICEF/WHO/World Bank Group: Joint child malnutrition estimates, UNICEF/WHO Low birthweight estimates, NCD Risk Factor Collaboration, WHO Global Health Observatory.

Notes: Data on the adult indicators are based on modelled estimates.

### Progress against global nutrition targets 2018
