#### **Southern Europe**

#### Subregional overview

#### Malnutrition burden

In the Southern Europe subregion, there has been some progress towards achieving global nutrition targets. The global target for female diabetes has five countries on course to meet it, low birth weight has four countries on course, under-five wasting has three countries on course, under-five overweight has two countries on course, while under-five stunting has one country on course. However, not a single country in the subregion is on course to meet the targets for infant exclusive breastfeeding, anaemia in women of reproductive age, male diabetes, male obesity, and female obesity. 12 countries in the subregion have insufficient data to comprehensively assess their progress towards these global targets.

Although it performs relatively well against other subregions, Southern Europe still experiences a malnutrition burden among its under-five population. The average prevalence of overweight in under-fives is 16.2% - the highest compared to other subregions in Europe. The prevalence of stunting in under-fives is 7.6%, this is significantly less than the global average of 21.9%. The Southern Europe subregion's prevalence of wasting in under-fives of 2.8% is also less than the global average of 7.3%.

Some 19.6% of infants under 23 months in the Southern Europe subregion are exclusively breastfed, while the subregion's average low birth weight prevalence of 7.3% is less than the global average of 14.6%.

The Southern Europe subregion's adult population also face a malnutrition burden. An average of 18.4% of women of reproductive age have anaemia, and 7.7% of adult men have diabetes, compared to 5.4% of women. Meanwhile, 22% of men and 21.4% of women have obesity.
