Argentina

Country overview

Malnutrition burden

Argentina is off course to meet the global targets for anaemia in women of reproductive age, low birth weight, male diabetes, female diabetes, male obesity, and female obesity. There is insufficient target data to assess Argentina's progress for under-five overweight, under-five stunting, under-five wasting, and infant exclusive breastfeeding.

Although it performs relatively well against other developing countries, Argentina still experiences a malnutrition burden among its under-five population. As of 2005, the national prevalence of under-five overweight is 9.9%. The national prevalence of under-five stunting is 8.2%, which is significantly less than the developing country average of 25%. Argentina's under-five wasting prevalence of 1.2% is also less than the developing country average of 8.9%.

In Argentina, 32% of infants under 6 months are exclusively breastfed, this is well below the South America average of 57.3%. Argentina's 2015 low birth weight prevalence of 7.3% has decreased slightly from 7.4% in 2000.

Argentina's adult population also face a malnutrition burden. 18.6% of women of reproductive age have anaemia, and 9.9% of adult men have diabetes, compared to 9.5% of women. Meanwhile, 29% of women and 27.3% of men have obesity.
