### **Central Asia**

#### **Overview**

#### **Nutritional** information

In Central Asia, there has been some progress towards achieving global nutrition targets. 3 countries are on course to meet the global targets for each of under-five stunting and under-five wasting. 2 countries are on course for under-five overweight. 1 country is on course for low birth weight. However, no countries in Central Asia are on course for each of infant exclusive breastfeeding, anaemia in women of reproductive age, male diabetes, female diabetes, male obesity, and female obesity. 2 countries in Central Asia have insufficient data to comprehensively assess their progress towards these global targets.

Although it performs relatively well against other subregions, Central Asia still experiences a malnutrition burden among its under-five population. The average prevalence of overweight in under-fives is 9.4% - the highest compared to other subregions in Asia. The prevalence of stunting in under-fives is 10.9%, this is significantly less than the global average of 21.9%. Central Asia's wasting in under-fives prevalence of 3.6% is also less than the global average of 7.3%.

Some 40.9% of infants under 23 months in Central Asia are exclusively breastfed, while the subregion's average low birth weight prevalence of 5.4% is less than the global average of 14.6%.

Central Asia's adult population also face a malnutrition burden. An average of 33.8% of women of reproductive age have anaemia, and 11% of adult men suffer from diabetes, compared to 10.9% of women. Meanwhile, 19.8% of women and 15% of men suffer from obesity.

Sources: UNICEF/WHO/World Bank Group: Joint child malnutrition estimates, NCD Risk Factor Collaboration, WHO Global Health Observatory.

Notes: Thresholds for a country having the form or not: stunting in children aged under-five years >20%; anaemia in women of reproductive age >20%; overweight (body mass index >25) in adult women aged >18 years >35%.
