Democratic People's Republic of Korea

Overview

Malnutrition status

The Democratic People's Republic of Korea is on course to meet the global targets for under-five stunting, under-five wasting, infant exclusive breastfeeding, and female diabetes, but is off course to meet the targets for under-five overweight, anaemia in women of reproductive age, male diabetes, male obesity, and female obesity. There is insufficient target data to assess the Democratic People's Republic of Korea's progress for low birth weight.

Although it performs well against other developing countries, the Democratic People's Republic of Korea still experiences a malnutrition burden among its under-five population. As of 2017, the national prevalence of under-five overweight is 2.3%, which has increased slightly from 0% in 2002. The national prevalence of under-five stunting is 19.1%, which is less than the developing country average of 25%. the Democratic People's Republic of Korea's under-five wasting prevalence of 2.5% is also less than the developing country average of 8.9%.

In the Democratic People's Republic of Korea, 71.4% of infants under 23 months are exclusively breastfed, this is well above the Eastern Asia average of 19.9%. There is insufficient data on low birth weight.

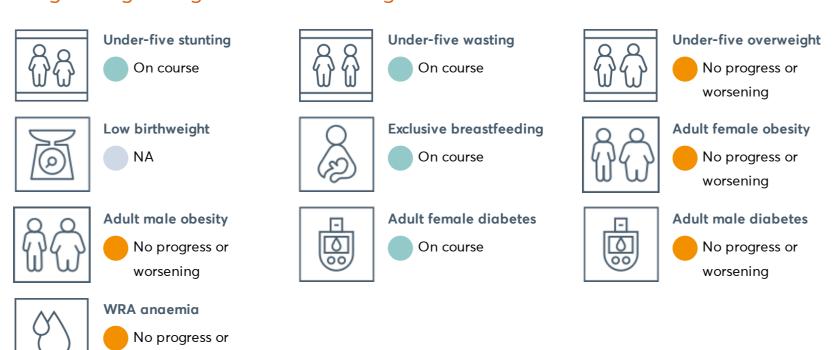

The Democratic People's Republic of Korea's adult population also face a malnutrition burden. While there is no prevalence data available for anaemia among women of reproductive age, 5.9% of adult women suffer from diabetes, compared to 5.8% of men. Meanwhile, 7.3% of women and 6.1% of men suffer from obesity.
