# South Sudan

# **Country overview**

### Malnutrition burden

South Sudan is off course to meet the global targets for anaemia in women of reproductive age. There is insufficient target data to assess South Sudan's progress for all other targets analysed.

South Sudan experiences a malnutrition burden among its under-five population. As of 2010, the national prevalence of under-five overweight is 5.8%, which has decreased from 10.9% in 2006. The national prevalence of under-five stunting is 31.3%, which is greater than the developing country average of 25%. South Sudan's under-five wasting prevalence of 24.3% is also greater than the developing country average of 8.9%.

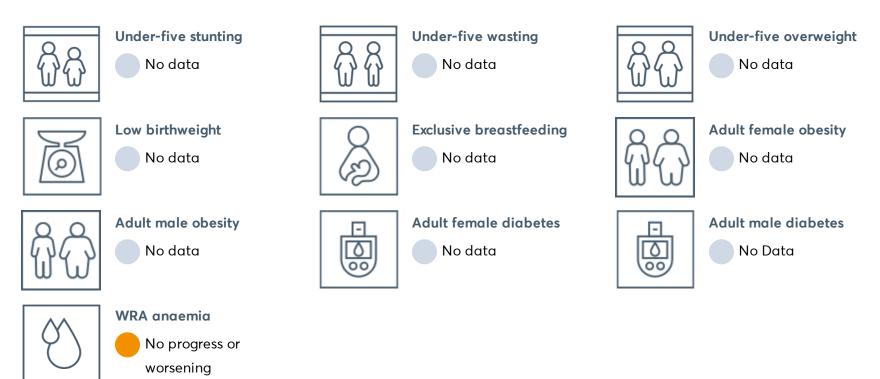

In South Sudan, 44.5% of infants under 6 months are exclusively breastfed, this is well below the Eastern Africa average of 58.5%. There is insufficient data on low birth weight.

South Sudan's women of reproductive age face a malnutrition burden in anaemia. As of 2016, this stands at 34%. There is no prevalence data available for adult diabetes or adult obesity.
