#### Romania

#### **Country overview**

#### Malnutrition burden

Romania is off course to meet the global targets for anaemia in women of reproductive age, low birth weight, male diabetes, female diabetes, male obesity, and female obesity. There is insufficient target data to assess Romania's progress for under-five overweight, under-five stunting, under-five wasting, and infant exclusive breastfeeding.

Although it performs relatively well against other countries, Romania still experiences a malnutrition burden among its under-five population. As of 2002, the national prevalence of under-five overweight is 8.3%, which has decreased slightly from 9.1% in 2001. The national prevalence of under-five stunting is 12.8%, which is less than the global average of 21.9%. Romania's under-five wasting prevalence of 3.5% is also less than the global average of 7.3%.

In Romania, 15.8% of infants under 6 months are exclusively breastfed. Romania's 2015 low birth weight prevalence of 8.2% has decreased slightly from 8.8% in 2000.

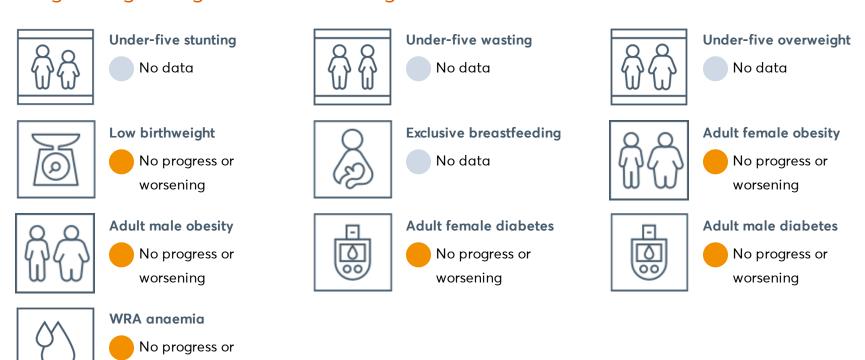

Romania's adult population also face a malnutrition burden. 26.7% of women of reproductive age have anaemia, and 7.3% of adult men have diabetes, compared to 6.4% of women. Meanwhile, 23.4% of men and 21.6% of women have obesity.
