Nauru

Country overview

Malnutrition burden

Nauru is on course to meet the global targets for male diabetes and female diabetes, but is off course to meet the targets for male obesity and female obesity. There is insufficient target data to assess Nauru's progress for under-five overweight, under-five stunting, under-five wasting, infant exclusive breastfeeding, anaemia in women of reproductive age, and low birth weight.

Although it performs relatively well against other developing countries, Nauru still experiences a malnutrition burden among its under-five population. As of 2007, the national prevalence of under-five overweight is 2.8%. The national prevalence of under-five stunting is 24%, which is less than the developing country average of 25%. Nauru's under-five wasting prevalence of 1% is also less than the developing country average of 8.9%.

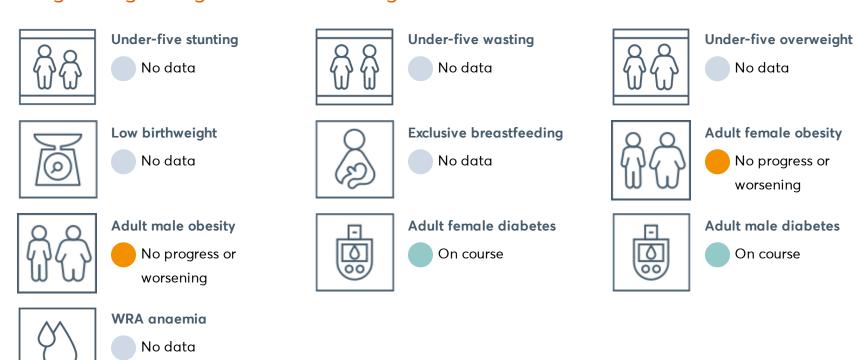

In Nauru, 67.2% of infants under 6 months are exclusively breastfed. There is insufficient data on low birth weight.

Nauru's adult population also face a malnutrition burden. While there is no prevalence data available for anaemia among women of reproductive age, 30.1% of adult men have diabetes, compared to 28.4% of women. Meanwhile, 63.3% of women and 58.7% of men have obesity.
